

Center for Vascular Malformations in Children

Josephinchen

Zentrum für Kinder-
und Jugendgesundheit

Does your child have a hemangioma (strawberry birthmark), a lymphangioma (lymph vessel abnormality) or other vascular malformation? Are you are looking for a clinic that offers the very best therapies and techniques for treating these vascular defects? Different therapeutic options are currently available to treat these vascular disfigurations:

- Application or injection of sclerosing agents (OK 432, Doxycyclin, Bleomycin, Alcohol)
- Interventional radiologic embolization (feeding vessels are closed via indwelling catheters)
- Laser Therapy
- Surgery
- Observation

Since 1995, the Clinic for Pediatric Surgery at St. Joseph Hospital in Berlin has specialized in treating vascular defects through laser therapy. We are now pleased to announce an exciting expansion of treatment options.

This unique cooperation allows us to bring together all the current knowledge, surgical techniques, and treatment options into one cutting-edge center for vascular defects. In addition, we are partnering with other clinics in Berlin, Germany, and Europe to build a broad-based treatment network for European patients.
